

Your Providenciales Forecast - Wednesday, September 08, 2010

Exclusively For:

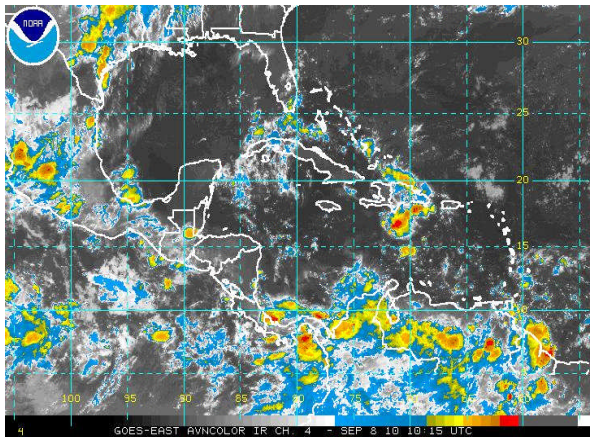

Prepared By:

High pressure is centered over the W'n Atlantic with associated ridging in place to the SW across the Turks and Caicos. The ridge will weaken through Saturday, and will remain weak into early next week as a broad/complex low pressure trough becomes established to the north. The remnant low associated with former Tropical Storm Gaston is moving W'ward across the N'n Caribbean this morning, just to the south of the Dominican Republic, with associated scattered showers/squalls likely to affect the Turks and Caicos today.

Sunrise: **06:38 AM**
Sunset: **07:02 PM**

High Tide: **08:45 AM**
Low Tide: **09:14 PM**
